

Living for Solutions:  
Form follows function

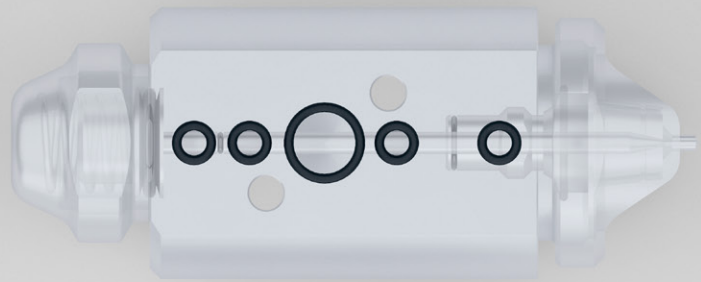

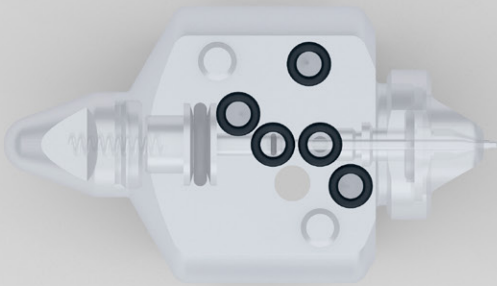

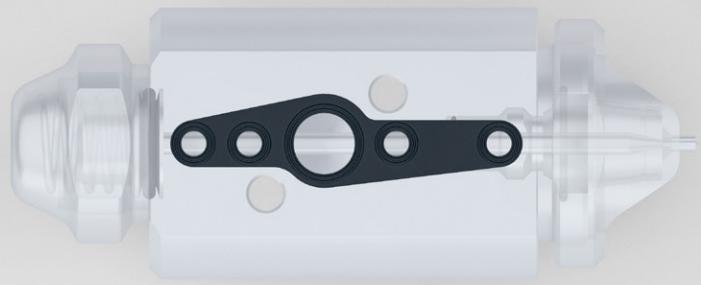

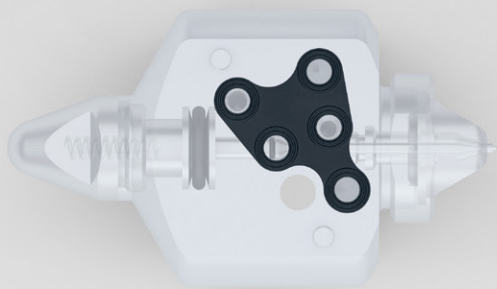

In contrast with individual O-rings, which can be mixed up or lost, flat gaskets are very simple to handle and increase the process reliability.

SCHLICK is able now to offer a compact flat gasket solution instead of single O-rings for PCA nozzles of the 930 and 970 model series. This is our answer on all requests to reduce process times and at the same time to increase product safety. The flat gasket solution replaces all five O-rings of the nozzle, which create the contact surface to the Professional Coating Arm. Due to its intelligent design, it cannot be mounted incorrectly and is easy for the user to grasp and insert by hand.

PCA nozzles with standard O-rings

PCA nozzles with new flat gasket

## The advantages of the flat gasket at a glance

### Safe.

Increased safety due to a double sealing lip.

### Sealed.

Maximum tightness even at higher pressure levels.

### Simple.

Problem-free and easy cleaning and care.

### Economical.

No impairment of the service life.

Your application. Our nozzle.  
Our promise: Living for solutions.

**Consultation, engineering, production and testing.**

At SCHLICK, you get everything from one source.

The ideal solution for your application.
